Art Unit: 3635

DETAILED ACTION

Claim Rejections - 35 USC § 103

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 1 and 23-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent #5,706,626 to MUELLER in view of either US Patent #4,037,381 to CHARLES or US Patent #5,390,466 to JOHNSON et al. In reference to claims 1 and 23, MUELLER discloses the use of a diaphragm (100) including structural panels (110a,b); a plurality of framing members (102a,b) (104,106) and (140) disposed in registry with a proximal side of the structural panel (110a,b); and a plurality of perimeter fasteners (124). MUELLER discloses the basic claimed diaphragm except for explicitly detailing the use of a means for reducing bending of the fasteners. Both brackets and washers are old and very well known in the art for their ability to reduce fasteners from bending as a result of forces being applied thereto. However, both CHARLES and JOHNSON et al. teach that it is known in the art to provide a structural panel with a means, either in the form of brackets (56) in CHARLES or washers (32,35) in JOHNSON et al., for reducing bending of fasteners. Hence, it would have been obvious tone having ordinary skill in the art at the time the invention was made to provide the structure of MUELLER with the means for reducing bending of fasteners of either CHARLES or JOHNSON et al. in order to ensure that the panel is structurally sound and capable of resisting forces imposed thereupon. Without additional bracket or

Art Unit: 3635

washers, when a force is imposed on the structure the fasteners will tend to break or fracture and not be able to maintain its structural integrity. However, brackets and washers provide fasteners with the strength needed to withstand forces imposed thereon. Regarding claim 24, the fasteners are closely spaced. In reference to claim 27, the means for reducing bending is a perimeter edging member (102a,b) (104) (106) (140) disposed near an edge face of the structural panel (110a,b). Regarding claim 28, the perimeter edging member (102a,b) (104) (106) (140) has a first face member (120). In reference to claim 29, the first face (120) is disposed on the distal side of the structural panel (110a,b). Regarding claim 30, the means for reducing bending (102a,b) (104) (106) (140) is made from light gauge sheet metal.

Claims 25 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent #5,706,626 to MUELLER. MUELLER discloses the basic claimed shear panel except for explicitly detail a fastener spacing of 2 inches and except for disclosing that his structural panels are wood. Regarding claim 25, MUELLER discloses a fastener spacing of 4 inches. Although MUELLER does not detail a spacing of 2 inches, it would have been obvious to one having ordinary skill in the art at the time the invention was made that the spacing is selected to depend upon the required rigidity of the connection and the material of the members forming the connection. For instance, an all metal panel used for installation in a building known for earthquake exposure might need the fasteners to be spaced closer; whereas if the very same panel were used in a building not known for earthquake exposure would do well with fasteners not so closely spaced. In reference to claim 26, again, it would have been obvious to one

Art Unit: 3635

having ordinary skill in the art at the time the invention was made to select a known material suitable for the use intended as an obvious matter of design choice. A wood panel for use in a low stress imposed residential environment performs well whereas a metal panel performs well in building in environments having large stresses imposed thereon.

Response to Arguments

Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Yvonne M. Horton whose telephone number is (571) 272-6845. The examiner can normally be reached on 6:30 am - 3:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Carl D. Friedman can be reached on (571) 272-6842. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
